

Information Security Management System (ISMS) Internal Control Audit: Employee Offboarding

Control ISO 27001 A.5.11	Requirement	Evidence	Risk	Recommendation
A.5.11 & A.6.5	All organizational assets (physical hardware and access items) must be returned upon termination of employment, and all digital access rights to systems and data must be formally revoked or modified immediately	Departing manager returned physical laptop and swipe card to their direct supervisor on their final day. The supervisor retained the hardware locally. IT department was notified via email three days post-termination to revoke digital system access accounts.	High Risk. The 3-day delay in notifying IT creates an access window where a terminated employee retains full cloud access via personal devices. This creates a severe threat of data exfiltration, intellectual property theft, or malicious unauthorized changes, exposing the company to regulatory penalties under GDPR / POPIA.	Implement an automated HR-to-IT ticketing workflow. HR must submit an offboarding request immediately upon receiving a resignation notice. IT must automatically revoke all logical access tokens and cloud account permissions at exactly 17:00 on the employee's final working day.
